Our Composite Fencing by UltraDeck® wood/plastic composite material is manufactured using post consumer wood products. Manufacturing with post consumer wood fiber eliminates the need to harvest trees in order to create building materials. Also, reusing this wood supply reduces the amount of materials delivered to your local landfill. Our state of the art extrusion process and raw material preparation in each package of fencing boards, produces a fully encapsulated wood plastic composite material that requires very little maintenance and will resist cracking and splintering as well as eliminating rot and mold usually found in wood fencing products.

Due to the presence of recycled materials, some color variation may occur.
